Microsoft

70-461 Exam

Microsoft Querying Microsoft SQL Server 2012/2014 Exam

Questions & Answers Demo

Version: 23.0

Question:	1
~	_

You use a Microsoft SQL Server database that contains a table. The table has records of web requests as shown in the exhibit. (Click the Exhibit button.)

HttpRequest

HttpRequestId

RequestDateTime

ClientIP

ClientUsername

ServerIP

ServerPort

HttpMethodId

UriStem

UriQuery

ServerStatus

ServerSubstatus

ServerWin32Status

BytesSent

BytesReceived

TimeTaken

ClientVersion

ClientHost

ClientUserAgentId

ClientId

SessionId

TimeSpent

Your network has three web servers that have the following IP addresses:

- 10.0.0.1
- 10.0.0.2

You need to create a query that displays the following information:

- The number of requests for each web page (UriStem) grouped by the web server (ServerIP) that served the request
- A column for each server

Which Transact-SQL query should you use?

```
Α
  SELECT
     UriStem,
     [10.0.0.1],
      [10.0.0.2],
      [10.0.0.3],
  FROM
    (SELECT HttpRequestId, ServerIP, UriStem FROM HttpRequest) r
  PIVOT (
  COUNT (r.HttpRequestId)
  FOR r.ServerIP IN ([10.0.0.1], [10.0.0.2], [10.0.0.3])
  ) AS pvt
  ORDER BY
   pvt.UriStem
В
   SELECT
     UriStem,
   SUM(CASE WHEN ServerIP = '10.0.0.1' THEN 1 ELSE 0 END) AS
   [10.0.0.1],
   SUM(CASE WHEN ServerIP = '10.0.0.2' THEN 1 ELSE 0 END) AS
   [10.0.0.2],
   SUM(CASE WHEN ServerIP = '10.0.0.3' THEN 1 ELSE 0 END) AS
   [10.0.0.3],
   FROM
       HttpRequest
   GROUP BY
       ServerIP
   ORDER BY
      UriStem
```

```
С
  SELECT
  UriStem,
  Server,
  Requests
  FROM
   (SELECT HttpRequestId, ServerIP, UriStem FROM HttpRequest) r
  Requests FOR Server IN ([ServerIP])
  ) AS pvt
  ORDER BY
  Pvt.UriStem
D
  DECLARE @Results TABLE (
   UriStem VARCHAR (255),
   [10.0.0.1] INT,
   [10.0.0.2] INT,
   [10.0.0.3] INT)
   INSERT INTO @Results (UriStem, [10.0.0.1])
   SELECT UriStem COUNT(HttpRequestId)
  FROM HttpRequest
  WHERE ServerIP - '10.0.0.1'
  UPDATE @Results
  SET [10.0.0.2] = COUNT(HttpRequestId)
  FROM HttpRequest h INNER JOIN @Results r ON h.UriStem =
  r.UriStem
  WHERE ServerIP = '10.0.0.2'
```

```
UPDATE @Results
 SET [10.0.0.3] = COUNT(HttpRequestId)
 FROM HttpRequest h INNER JOIN @Results r ON h.UriStem =
 r.UriStem
 WHERE ServerIP = '10.0.0.3'
 SELECT
       UriStem,
     [10.0.0.1] ,
     [10.0.0.2] ,
     [10.0.0.3]
 FROM
 @Results
A. Option A
B. Option B
C. Option C
D. Option D
                                                      Answer: A
```

Explanation:

PIVOT rotates a table-valued expression by turning the unique values from one column in the expression into multiple columns in the output, and performs aggregations where they are required on any remaining column values that are wanted in the final output.

References: https://docs.microsoft.com/en-us/sql/t-sql/queries/from-using-pivot-and-unpivot?view=sql-server-2017

Question: 2

DRAG DROP

You develop a Microsoft SQL Server database for a sales ordering application.

You want to create a report that displays the increase of order quantities over the previous year for each product.

You need to write a query that displays:

Product name,

Year of sales order,

Sales order quantity, and

Increase of order quantity over the previous year.

Which three Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Answer Area

FROM Sales.SalesOrderHeader SOH
INNER JOIN Sales.SalesOrderDetail SOD ON
SOH.SalesOrderID = SOD.SalesOrderID
INNER JOIN Production.Product PRO ON
SOD.ProductID = PRO.ProductID

SELECT Pro.Name, YEAR(OrderDate), SUM (SOD.OrderQty), SUM(SOD.OrderQty) -LAG(SUM(SOD.OrderQty), 1, 0) OVER (PARTITION BY PRO.Name ORDER BY YEAR (OrderDate) DESC)

GROUP BY PRO. Name, YEAR (OrderDate)

Explanation:

Box 1: FROM ..

Box 2: LAG (not LEAD)

Lag accesses data from a previous row in the same result set without the use of a self-join starting with SQL Server 2012 (11.x). LAG provides access to a row at a given physical offset that comes before the current row. Use this analytic function in a SELECT statement to compare values in the current row with values in a previous row.

Not lead: Lead accesses data from a subsequent row in the same result set without the use of a self-join starting with SQL Server 2012 (11.x). LEAD provides access to a row at a given physical offset that follows the current row.

Box 3: GROY BY PRO.NAME, YEAR (OrderDate)

References: https://docs.microsoft.com/en-us/sql/t-sql/functions/lag-transact-sql?view=sql-server-2017

Question: 3

You develop a Microsoft SQL Server database that contains a table named Employee, defined as follows:

Questions & Answers PDF

```
CREATE TABLE [dbo].[Employee]
(
[EmployeeID] int PRIMARY KEY
[Firstname] varchar(50) NOT NULL,
[LastName] varchar(50) NOT NULL,
[DepartmentID] int NOT NULL,
[HireDate] date NOT NULL
)
```

You need to create a view that contains two computed columns representing the month and the year of the [HireDate] of each Employee.

Which function should you use?

```
A. DATENAME()
B. CONVERT()
```

C. TRYDATEDIFF()

D. MONTH() and YEAR()

Answer: D

Explanation:

The Month function returns an integer that represents the month of the specified date.

The Year function an integer that represents the year of the specified date.

References:

https://docs.microsoft.com/en-us/sql/t-sql/functions/month-transact-sql?view=sql-server-2017 https://docs.microsoft.com/en-us/sql/t-sql/functions/year-transact-sql?view=sql-server-2017

Qu	estion	: 4

You administer a Microsoft SQL Server database named ContosoDb. The database has the following schema collection:

```
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"</pre>
targetNamespace="http://tempuri.org/po.xsd"
xmlns="http://tempuri.org/po.xsd"
elementFormDefault="qualified">
<xs:element name="purchaseOrder" type="PurchaseOrderType"/>
<xs:complexType name="PuchaseOrderType">
<xs:sequence>
<xs:element name="items" type="Items"/>
</xs:sequence>
<xs:attribute name="orderDate" type="xs:date"/>
<xs:attribute name="requiresApproval" type="xs:boolean"/>
</xs:complexType>
<xs:complexType name ="Items">
<xs:sequence>
<xs:element name="item" minOccurs="0" maxOccurs="unbounded">
<xs:complexType>
<xs:sequence>
<xs:element name="productName" type="xs:string"/>
<xs:element name="quantity" type="xs:positiveInteger"/>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:sequence>
</xs:complexType>
</xs:schema>
```

The database has a table named ReceivedPurchaseOrders that includes an XML column named PurchaseOrder by using the above schema.

You need to set the requiresApproval attribute of the XML documents to false if they contain more than 50 items.

Which Transact-SQL query should you run?

```
Α
   UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify('
     declare namespace MI="http:/ tempuri.org/po.xsd";
     replace value of (/MI:purchaseOrder/MI:requiresApproval)
      with (
      if (count(/MI:purchaseOrder/MI:items/MI:item)>50) then
             xs:boolean("true")
     else
             xs:boolean("false")
   )');
В
   UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify('
     declare namespace MI="http:/tempuri.org/po.xsd";
     replace value of (/MI:purchaseOrder/MI:requiresApproval)
      with (
      if (count(/MI:purchaseOrder/MI:items)>50) then
             xs:boolean("true")
     else
             xs:boolean("false")
   )');
```

```
С
    UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify('
      declare namespace MI="http://tempuri.org/po.xsd";
      replace value of (/MI:purchaseOrder/@requiresApproval)[1]
       with (
       if (count(/MI:purchaseOrder/MI:items/MI:item)>50) then
                xs:boolean("true")
      else
               xs:boolean("false")
    )');
D
   UPDATE ReceivedPurchaseOrders SET PurchaseOrder.modify('
     declare namespace MI="http:/tempuri.org/po.xsd";
      replace value of (/MI:purchaseOrder/@requiresApproval)[1]
       with (
       if
           (count(/MI:purchaseOrder/MI:items)>50) then
               xs:boolean("true")
      else
               xs:boolean("false")
   )');
A. Option A
B. Option B
C. Option C
D. Option D
                                                            Answer: D
Explanation:
Replace value of (XML DML) updates the value of a node in the document.
Example: -- update text in the first manufacturing step
SET @myDoc.modify('
replace value of (/Root/Location/step[1]/text())[1]
with "new text describing the manu step"
```

Question: 5

DRAG DROP

');

Your Microsoft SQL Server database contains tables as shown below.

You have tables that were created by running the following Transact-SQL statements:

Questions & Answers PDF

```
CREATE TABLE dbo.Category
CategoryID INT NOT NULL IDENTITY(1,1) CONSTRAINT PK Category
PRIMARY KEY CLUSTERED
, CategoryName VARCHAR(200) NOT NULL
, ProductDescription VARCHAR (1000) NULL
 IsActive BIT DEFAULT (1)
GΟ
CREATE TABLE dbo.Product
(
ProductID INT NOT NULL IDENTITY (1,1) CONSTRAINT PK Product
PRIMARY KEY CLUSTERED
, ProductName VARCHAR(200) NOT NULL
, CategoryID INT NOT NULL
 ProductDescription VARCHAR (1000) NULL
 ListPrice MONEY NOT NULL
, Quantity INT NOT NULL
 CONSTRAINT FK Product Category FOREIGN KEY (CategoryID)
REFERENCES Category(CategoryID)
)
GO
```

The Product table contains 10,000 records. The maximum ProductID is 11,000.

There are 12 rows in the Category table. The maximum CategoryID is 12.

The Product table contains at least one product in every category.

Data in the tables was accidently modified. To correct this, you need to make some updates directly to the tables. You issue several statements.

Which result or results will you obtain for each Transact-SQL statement? To answer, drag the appropriate results to the correct Transact-SQL statements. Each result may be used once. More than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

The statement succeeds.	dbo.Product (Product)	RT dbo.Product ON;INSERT D, ProductName, categoryID,	Result
The statement fails because the syntax is		istPrice, Quantity) VALUES ogurt', 9 ", 0.98*6, 57);SET bo.Product OFF;	
incorrect.	DELETE dbo.Catego	ry WHERE CategoryID = 11	Result
he statement fails because the primary key constraint in the Product table is violated.		(ProductName, CategoryID, ALUES ('Chocolate Cake', 25,	Result
he statement fails because the value for an lentity column cannot be explicitly specified during an insert		1	
The statement fails because the foreign key	UPDATE dbo.Category SET IsActive='' WHERE CategoryID = 5	ry SET IsActive='-' WHERE	Result
The statement fails because an identity column value cannot ba changed during an update statement.			
The statement fails because the data type is incorrect for one of the fields.			
The statement fails because the data		- -	Answer:
The statement fails because the data type is incorrect for one of the fields.		_	Answer:
The statement fails because the data type is incorrect for one of the fields.	me, CategoryID, htity) VALUES 8*6, 57);SET	The statement succeed	
The statement fails because the data type is incorrect for one of the fields. atement SET IDENTITY_INSERT dbo.Product dbo.Product (ProductID, ProductID,	me, CategoryID, htity) VALUES 18*6, 57);SET :		
The statement fails because the data type is incorrect for one of the fields. atement SET IDENTITY_INSERT dbo.Product dbo.Product (ProductID, ProductNa ProductDescription, ListPrice, Quar (20000), "Strawberry Yogurt", 9, ", 0.4	me, CategoryiD, nitry) VALUES 18*6, 57);SET 1; goryiD = 11; CategoryiD,	The statement fails bed violated.	is.

Explanation:

Box 1:

The SET IDENTITY_INSERT command allows explicit values to be inserted into the identity column of a

table.

Box 2:

The Product table contains at least one product in every category.

Box 3:

Box 4:

Bit is a data type that can take a value of 1, 0, or NULL.

References:

https://docs.microsoft.com/en-us/sql/t-sql/data-types/bit-transact-sql?view=sql-server-2017 https://docs.microsoft.com/en-us/sql/t-sql/statements/set-identity-insert-transact-sql?view=sql-server-2017

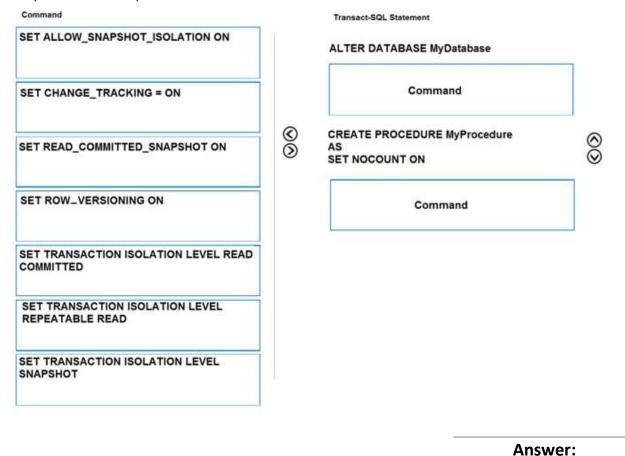

Question: 6

DRAG DROP

You develop an application that uses data from a Microsoft SQL Server database.

Your application experiences blocking problems.

You need to enable row versioning and you want connections to have row versioning enabled by default. How should you complete the Transact-SQL statement? To answer, drag the appropriate command to the correct positions. Each command may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Transact-SQL Statement

ALTER DATABASE MyDatabase

SET READ_COMMITTED_SNAPSHOT ON

CREATE PROCEDURE MyProcedure AS SET NOCOUNT ON

SET ALLOW_SNAPSHOT_ISOLATION ON

Explanation:

You can use a row versioning-based isolation level.

Set READ_COMMITTED_SNAPSHOT database option ON to enable read-committed transactions to use row versioning, and use snapshot isolation.

References: https://docs.microsoft.com/en-us/sql/relational-databases/sql-server-transaction-locking-and-row-versioning-guide?view=sql-server-2017

Question: 7

DRAG DROP

You are a developer for a Microsoft SQL Server database. You need to write a stored procedure that performs several operations in the most efficient way possible.

Which operator or operators should you use? To answer, drag the appropriate operators to the correct operations. Each operator may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

			Answ	er:
INTERSECT				
INNER JOIN		L		
FULL OUTER JOIN		Join two related result sets and return all records from both.	Operator	
EXCEPT		Compare records from two related result sets. If there are differences, insert new records and update existing ones.	Operator	
ANY	© ③	Join two result sets and return all related records, including duplicates.	Operator	8
MERGE		Combine two result sets and return all distinct records with matching values.	Operator	
UNION ALL		Combine two unrelated result sets and return all records, including duplicates.	Operator	
Operators			Operation	

Operation Combine two unrelated result UNION ALL sets and return all records, including duplicates. Combine two result sets and INTERSECT return all distinct records with matching values. Join two result sets and **INNER JOIN** return all related records, including duplicates. Compare records from two MERGE related result sets. If there are differences, insert new records and update existing ones. Join two related result sets and **FULL OUTER JOIN** return all records from both.

Explanation:

Box 1: UNION ALL

UNION combines the results of two or more queries into a single result set that includes all the rows that belong to all queries in the union.

UNION ALL Incorporates all rows into the results. This includes duplicates. If ALL is not specified, duplicate rows are removed.

Box 2: INTERSECT

INTERSECT returns distinct rows that are output by both the left and right input queries operator.

Box 3: INNER JOIN

The INNER JOIN keyword selects records that have matching values in both tables.

Box 4: MERGE

Merge performs insert, update, or delete operations on a target table based on the results of a join with a source table. For example, you can synchronize two tables by inserting, updating, or deleting rows in one table based on differences found in the other table.

Box 5: FULL OUTER JOIN

The FULL OUTER JOIN keyword return all records when there is a match in either left (table1) or right (table2) table records.

Note: FULL OUTER JOIN can potentially return very large result-sets!

Question: 8

```
You develop a database application for Microsoft SQL Server and Microsoft Azure SQL Database.
You need to raise an exception and transfer execution to a CATCH block.
You need to ensure that the exception returns output in the following format:
Msg 51000, Level 16, State 1, Line 1
The record does not exist.
Which Transact-SQL statement should you run?
Α
   DECLARE @Message NVARCHAR(2048);
   SELECT @Message = FORMATMESSAGE('The record does not exist.');
   THROW 51000
   , 1
    , @Message
В
    THROW 51000
    , 'The record does not exist.'
    , 1
С
   THROW ERROR MESSAGE
   ( 'The record does not exist.'), 1
D
   THROW 51000
   , FORMATMESSAGE('The record does not exist.')
   , 1
A. Option A
B. Option B
C. Option C
D. Option D
                                                                        Answer: B
```

Explanation:

The following example shows how to use the THROW statement to raise an exception.

THROW 51000, 'The record does not exist.', 1;

Here is the result set.

Msg 51000, Level 16, State 1, Line 1

The record does not exist.

https://docs.microsoft.com/en-us/sql/t-sql/language-elements/throw-transact-References:

sql?view=sql-server-2017

Question: 9

DRAG DROP

You develop a database application for Microsoft SQL Server 2012 and Microsoft Azure SQL Database. You create a table named Purchasing.vVendorWithAddresses as shown in the following table.

	BusinessEntityID	Name	Address	City	StateProvinceName	PostalCode
1	1492	Australia	28 San	Bellingham	Washington	98225
		Bike	Marino Ct.			
		Retailer				
2	1494	Allenson	4659	Altadena	California	91001
		Cycles	Montoya			
3	1496	Advanced	7995	Lynnwood	Washington	98036
		Bicycles	Edwards			
			Ave.			
4	1498	Trikes, Inc.	90 Sunny	Berkley	California	94704
			Ave			
5	1500	Morgan	9098 Story	Albany	New York	12210
		Bike	Lane			
		Accessories				
6	1502	Cycling	4823	Walla	Washington	99362
		Master	Stonewood	Walla		
			Ct.			
7	1504	Chicago	15 Pear	Newport	California	92625
		Rent-All	Dr.	Beach		
8	1506	Greenwood	6441 Co	Lemon	Arizona	85252
		Athletic	Road	Grove		
		Company				
9	1508	Compete	50 Via Del	Lynnwood	Washington	98036
		Enterprises,	So1			
		Inc.				
10	1510	International	683 Larch	Salt Lake	Utah	84101
			Ct.	City		

You write the following Transact-SQL (Line numbers are included for reference only.) 01 CREATE PROCEDURE

- 02 usp GetVendorNeighbors
- 03 @vendorname nvarchar(50)
- 04 AS
- 05 SELECT name FROM
- 06 Purchasing.vVendorWithAddresses t
- 07 WHERE
- 08 . . .

You need to add Transact-SQL statements at line 08 to ensure that GetVendorInStateNeighbors returns the names of vendors that are located in all states where the vendor specified in the @vendorname parameter has a location.

Which three Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

Statements	Answer Area	
StateProvince IN (
(
SELECT StateProvince FROM Purchasing.VendorWithAddresses	©	⊗
WHERE Name = @vendorname)	0	lacksquare
EXISTS (
v.Name = @vendorname		
AND 1 = 1 }	<u> </u>	
SELECT Name FROM Purchasing.VendorWithAddresses WHERE s.name = @vendorname		
		Answer:

Answer Area

StateProvince IN (

SELECT StateProvince FROM Purchasing.VendorWithAddresses

WHERE Name = @vendorname

Explanation:

The IN statement determines whether a specified value matches any value in a subquery or a list. Incorrect:

The EXISTS command specifies a subquery to test for the existence of rows.

References: https://docs.microsoft.com/en-us/sql/t-sql/language-elements/in-transact-sql?view=sql-server-2017

Question: 10

A local bank uses a SQL Server database to manage accounts. You are developing a stored procedure that contains multiple Transact-SQL INSERT statements.

The stored procedure must use transaction management to handle errors.

You need to ensure that the stored procedure rolls back the entire transaction if a run-time occurs.

Which Transact-SQL statement should you add to the stored procedure?

A. SET ARITHABORT ON

B. SET NOEXEC ON

C. SET TRANSACTION ISOLATION LEVEL ON

D. SET XACT_ABORT ON

Answer: D

Explanation:

SET XACT_ABORT specifies whether SQL Server automatically rolls back the current transaction when a Transact-SQL statement raises a run-time error.

When SET XACT_ABORT is ON, if a Transact-SQL statement raises a run-time error, the entire transaction

is terminated and rolled back.

 $References: \\ \underline{https://docs.microsoft.com/en-us/sql/t-sql/statements/set-xact-abort-transact-$

sql?view=sql-server-2017
