DMF-1220 Exam

Data Management Fundamentals

Questions & Answers Demo

Version: 4.0

Question: 1	
The most informal enterprise data model is the most detailed data architectu A.TRUE B. FALSE	re design document.
	Answer: B
Question: 2	
The goal of data architecture is to:	
 A. Serve as a platform to enable data governance and management B. Bridge between business strategy and technology execution C. Provide the organisation with clear system of the architecture D. Make the integration between data management and data analytics possible 	ole
	Answer: B
Question: 3	
Data architects facilitate alignment between [1] and [2]	
A. [1] Business and [2] IT B. [1] Technology and [2] Data C. [1] Governance and [2] Management D. [1] Strategy and [2] Execution	
	Answer: A
	7.11.000-01.71
Question: 4	
A goal of data architecture is to identify data storage and processing requirem	nents.
A. TRUE B. FALSE	
	Answer: A
Question: 5	

The deliverables in the data architecture context diagram	include:
A. Data flows B. Enterprise data C. Implementation roadmap D. Data Value Chains E. None of the above F. All of the above	
	Answer: F
Question: 6	
The purpose of enterprise application architecture is to applications in an enterprise.	describe the structure and functionality of
A. TRUE B. FALSE	
	Answer: A
Question: 7 The dependencies of enterprise technology architecture to business requirements. A. TRUE B. FALSE	are that it acts on specified data according
	Answer: B
Question: 8 The roles associated with enterprise data architecture a stewards. A. TRUE B. FALSE	re data architect, data modellers and data
	Answer: A
Question: 9	

The Zachman Framweork's communication interrogative columns provides guidance on defining enterprise architecture. Please select answer(s) that is(are) coupled correctly:

C. When -> The timing column C. Why -> The motivation column D. Who -> The responsibility column E. How -> The process column Answer: A, C, D, E, F Question: 10 What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above Answer: A, C, D	A. What -> The inventory Column B. What -> The entity column	
C. Why -> The motivation column D. Who -> The responsibility column E. How -> The process column Answer: A, C, D, E, F Question: 10 What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
E. How -> The process column Answer: A, C, D, E, F		
Answer: A, C, D, E, F Question: 10 What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	D. Who -> The responsibility column	
What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	E. How -> The process column	
What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		Answer: A, C, D, E, F
What model is the highest level model within the enterprise data model? A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
A. Logical model B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	Question: 10	
B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	What model is the highest level model within the enterprise data model	1?
B. Physical model C. Conceptual model D. Subject Area model Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	A. Logical model	
Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
Answer: C Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	C. Conceptual model	
Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	D. Subject Area model	
Question: 11 For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		Answer: C
For each subject area logical model: Decrease detail by adding attributes and less-significant entities and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
and relationships. A. TRUE B. FALSE Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	Question: 11	
Answer: B Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	and relationships.	es and less-significant entities
Question: 12 Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		Answer: B
Data flows map and document relationships between data and: A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above		
A. Locations where local differences occur B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	Question: 12	
B. Situations where local differences occur C. Network segments D. Applications within a business process E. None of the above F. All of the above	Data flows map and document relationships between data and:	
C. Network segments D. Applications within a business process E. None of the above F. All of the above	A. Locations where local differences occur	
D. Applications within a business process E. None of the above F. All of the above	B. Situations where local differences occur	
E. None of the above F. All of the above	_	
F. All of the above		
Answer: A, C, D	F. All of the above	
		Answer: A, C, D
	•	
Question: 13		

Enterprise data architecture usually include the following work streams	:
A. Strategy B. Governance C. Organization D. Results E. Working methods F. All of the above	
	Answer: A, C, D
Question: 14	
A roadmap for enterprise data architecture describes the architecture path. The roadmap should be guided by a data management maturity at A. TRUE B. FALSE	
	Answer: A
Question: 15	
Enterprise data architecture project-related activities include:	
A. Define maturity assessment B. Define scope C. Design D. Implement E. None of the above F. All of the above	
	Answer: B, C, D

Question: 16

The process of building architectural activities into projects also differ between methodologies. They include:

- A. Waterfall methods
- B. Incremental methods
- C. Kanban method
- D. Agile iterative method
- E. Duck and dive method
- F. Pump and dump method

		Answer: A, C, D
Question: 17		
Question: 17		
Data modelling tools and model in all levels.	I repositories are necessary for managi	ng the enterprise data model
A. TRUE B. FALSE		
		Answer: A
Question: 18		
Characteristics that minimise di to, consistent object attributes	stractions and maximise useful informa	ation include, but not limited
A. TRUE		
B. FALSE		
		Answer: A
Question: 19		
A deliverable in the data modell	ing and design context diagram is the lo	gical data model.
A. TRUE		
B. FALSE		
		Answer: A
Question: 20		
Inputs in the data modelling and	design context diagram include:	
A. Data standards		
B. Data sets		
C. Data Management Architectu	re	
D. Systems Architecture		
E. Data architecture		
F. Enterprise taxonomy		
		Answer: A, B, E, F
